Quiz,	10	questions

1 point	1.	Suppose a web log is modified to now have a sixth piece of information, a priority, that can be represented as a String.		
		Which one of the following is the <u>least</u> likely change to the LogEntry class to accommodate this new part of a web log?		
		A new getPriority method is created to return the priority.		
		A new String parameter is added to the constructor.		
		A new String field is initialized in the constructor. The toString method is modified to include the new priority as part of the		
		return String.		
		The toString method is modified to include a String parameter. A new private variable named priority is created.		
		A new private variable named priority is created.		
1	2.	Consider the following code for the readFile method of the LogAnalyzer class.		
point	∠ .	<pre>public void readFile(String filename) { FileResource fr = new FileResource(filename);</pre>		
		for (String line : fr.lines()) { LogEntry le = WebLogParser.parseEntry(line); }		
		6 }		
		In the Tester class, readFile is called with a correct filename, and then printAll is called, but nothing is printed.		
		Which one of the following is likely the best reason why? In readFile , the log entries were not stored in records .		
		In readFile , a System.out.println statement is missing from the body of the		
		for loop. In readFile , a System.out.println statement is missing that should be right		
		before the for loop.		
		In readFile , a System.out.println statement is missing that should be right after the for loop.		
		In readFile , the wrong parameter is sent to parseEntry .		
1	3.	Consider the following code for the method printAllHigherThanNum with one integer		
point	0.	parameter num . This method should print all the logs that have a status code higher than num .		
		Which one of the following would be the best choice for suitable code for this method?		
		<pre>1 if (le.getStatusCode() > num) { 2 for (LogEntry le : records) { 3 if (le.getStatusCode() > num) { 4</pre>		
		<pre>4</pre>		
		1 if (le.getStatusCode() > num) {		
		<pre>for (LogEntry le : records) { System.out.println(le); 4 } 5 }</pre>		
		1 if (le.getStatusCode() > num) {		
		<pre>for (LogEntry le : records) { System.out.println(le); } }</pre>		
		<pre>5 } 6 else { 7 System.out.println(); 8 }</pre>		
		1 for (LogEntry le : records) {		
		<pre>if (le.getStatusCode() > num) { System.out.println(le); } else {</pre>		
		6 System.out.println(); 7 } 8 }		
		<pre>1 for (LogEntry le : records) { 2 if (le.getStatusCode() > num) {</pre>		
		3 System.out.println(le); 4 } 5 }		
1 4.	4.	Run the method countUniqueIPs on the file weblog2_log .		
point		How many unique IP addresses are in the file?		
		45		
1 point	5.	Run the method uniquelPVisitsOnDay("Sep 27") on the file weblog2_log. What size is the ArrayList that is returned?		
		8		
1	6.	Run the method countUniquelPsInRange(200,299) on the file weblog2_log.		
point		What number is returned?		
		23		
1 point	7.	Run the method mostNumberVisitsByIP after a HashMap has been created from the method countVisitsPerIP on the file weblog2_log .		
- mari		What number is returned?		
		63		
		Pun the mothod iDeMastVisite often a HashMan back in the control of the control o		
1 point	8.	Run the method iPsMostVisits after a HashMap has been created from the method countVisitsPerIP on the file weblog2_log.		
		What single IP address is returned in the ArrayList? 103.57.41.178		
		188.162.84.63		
		200.69.213.251		
		210.4.104.99		
		212.128.74.248		
1 point	9.	Run the method dayWithMostIPVisits with a HashMap has been created from the method iPsForDays on the file weblog2_log .		
		What day is returned?		
		Sep 24		
		Sep 26 Sep 28		
		Sep 28 Sep 30		
1 10. point		Run the method iPsWithMostVisitsOnDay with two parameters—one, a HashMap that has been created from the method iPsForDays on the file weblog2_log and two, the day "Sep 29".		
		One IP address is returned in the ArrayList—what is it?		
		103.57.41.178		
	188.162.84.63 210.4.104.99			
		212.128.74.248		

212.185.210.111
