Quiz, 7 questions

oint		
		Danish
		Dutch
		English
		French
		German
		() Italian
		Portuguese
		Spanish
		Spanish
point	2.	What is the <u>first line</u> of the message you decrypted from secretmessage3.txt ? La chambre à coucher de Juliette.
		La difamble à déderier de danette.
1	2	What is the language of secretmessage4.txt ?
1 point	3.	Danish
		Dutch
		English
		French
		German
		Italian
		Portuguese
		Spanish
1	4.	What is the <u>first line</u> of the message you decrypted from secretmessage4.txt ?
point		Drei Hexen treten auf.
1	5.	Recall that the choice to test key lengths 1–100 was arbitrary, and that the longer a key is with respect to an encrypted message, the less likely this Vigenère decryption algorithm is
1 point	5.	Recall that the choice to test key lengths 1–100 was arbitrary, and that the longer a key is with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work.
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain <u>no information</u> about an original
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain <u>no information</u> about an original message by analyzing the encrypted message?
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain <u>no information</u> about an original message by analyzing the encrypted message? 1/26 the message length
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain <u>no information</u> about an original message by analyzing the encrypted message? 1/26 the message length
	5.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length
		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation.
	 6. 	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high
point 1		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a').
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a'). The language of the original message has many characters not in the English alphabet.
point 1		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a').
point 1	6.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a'). The language of the original message has many characters not in the English alphabet. The language of the original message when written in sentences has different letter frequencies than the sum of individual words in the dictionary.
point		with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a'). The language of the original message has many characters not in the English alphabet. The language of the original message when written in sentences has different letter frequencies than the sum of individual words in the dictionary.
point 1 point	6.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a'). The language of the original message has many characters not in the English alphabet. The language of the original message when written in sentences has different letter frequencies than the sum of individual words in the dictionary. Consider the Vigenère decryption algorithm described in this lesson. Which one of the following could be a problem?
point 1 point	6.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.) The language of the original message has multiple letters of comparable high frequency. The language of the original message is not included in the dictionaries. The language of the original message has an unusual letter that is highest in frequency (not 'e' or 'a'). The language of the original message has many characters not in the English alphabet. The language of the original message when written in sentences has different letter frequencies than the sum of individual words in the dictionary.
point 1 point	6.	with respect to an encrypted message, the less likely this Vigenère decryption algorithm is to work. How long would a key have to be, so that you could gain no information about an original message by analyzing the encrypted message? 1/26 the message length Half the message length Exactly the message length There is no key length that ensures an unbreakable Vigenère implementation. The Vigenère decryption algorithm used in this lesson has limitations. In which of the following scenarios could the program return incorrect results? (Select all that are correct.)
